Concatenação *Concatenation*

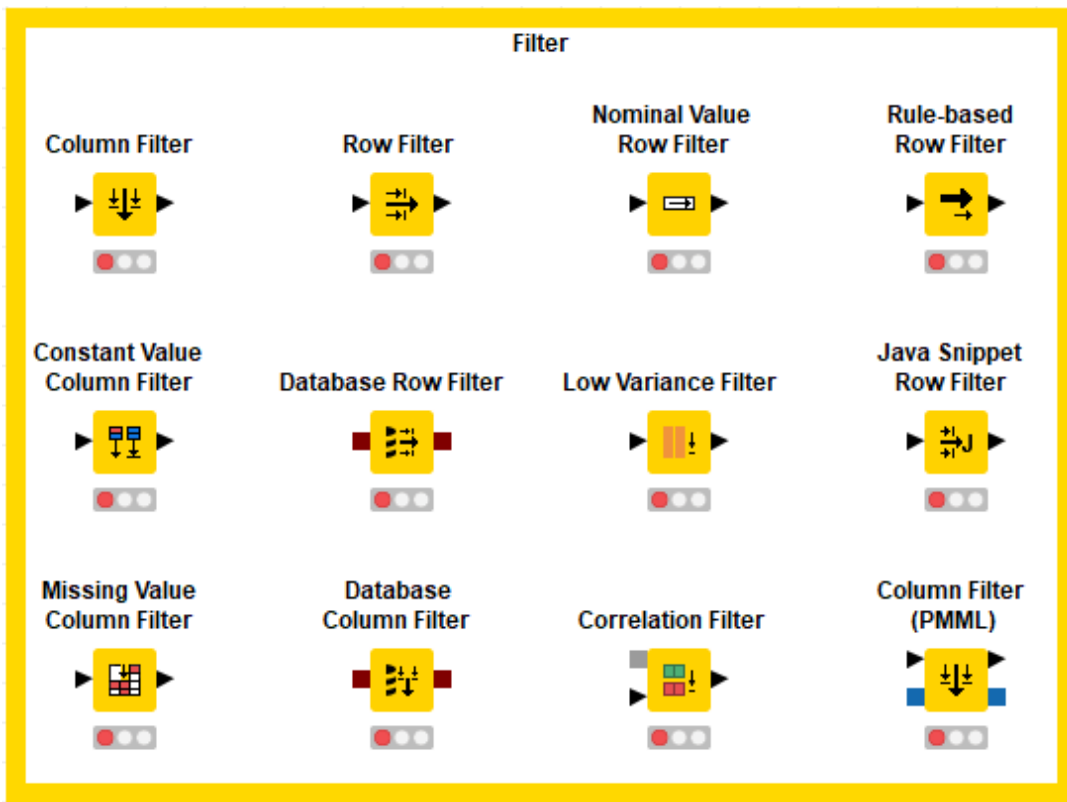

- Concatenate (Optional in) funciona como a concatenação (Concatenate), mas aceita até 4 *inputs*

Ordenação *Sorter*

- Altera a ordem das colunas de *input*, com base na definição dos parâmetros
- Ordena as linhas com base na definição dos parâmetros
- Permite que as linhas sejam classificadas a partir da tabela da base de dados de entrada
(cláusula SQL ORDER BY)

Node Description

Column Filter

This node allows columns to be filtered from the input table while only the remaining columns are passed to the output table. Within the dialog, columns can be moved between the Include and Exclude list.

Dialog Options

Include

This list contains the column names that are included in the output table.

Enforce Inclusion

Select this option to enforce the current inclusion list to stay the same even if the input table specification changes. If some of the included columns are not available anymore, a warning is displayed. (New columns will automatically be added to the exclusion list.)

Select

Use these buttons to move columns between the Include and Exclude list.

Search

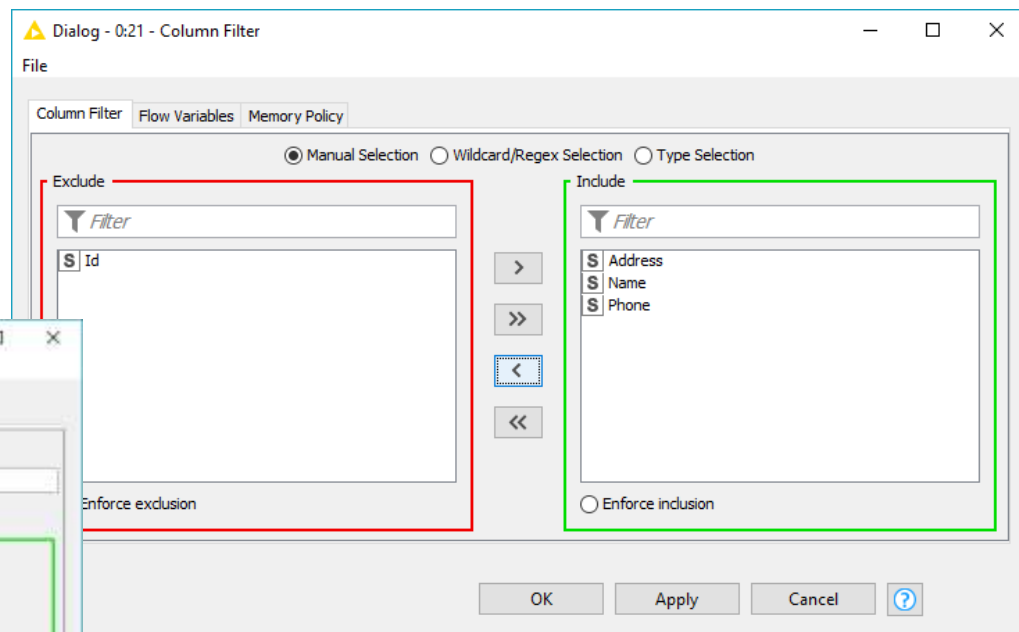

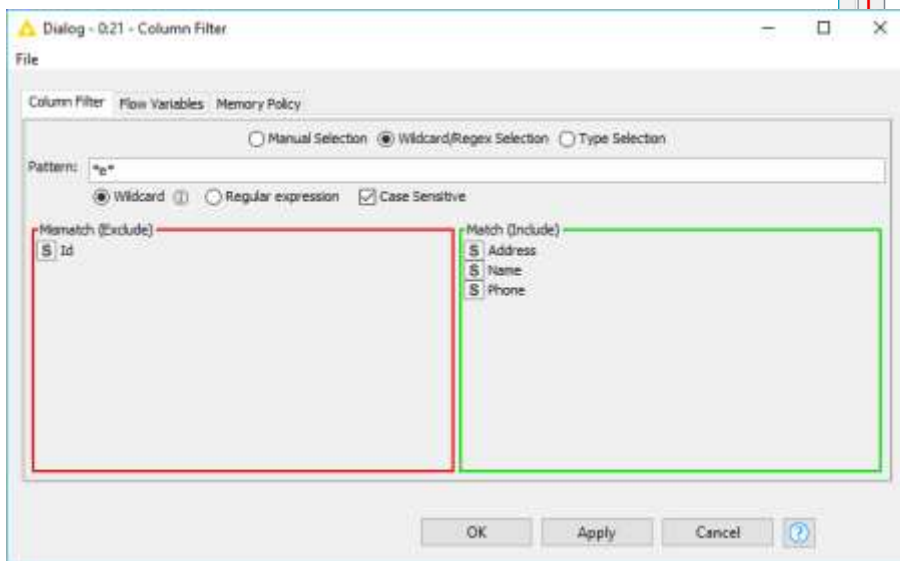

Use one of these fields to search either within the Include or Exclude list for certain column names or name substrings. Repeated clicking of the search button marks the next column that matches the search text. The check box 'Mark all search hits' causes all matching columns to be selected making them movable between the two lists.

- MISSING ?
- NOT ?
- TRUE

Description

Logical or of two boolean expressions. You can use this in a sequence, like A OR B OR C without parenthesis, but it has no precedence regarding to AND or XOR, so you have to use parenthesis around the logical connectives if you want to combine them.
(Short-circuit evaluation.)

Expression

```
1 //Enter ordered set of rules!!!!!!
2 //TRUE => TRUE
3 $Name$ = "Ana" OR $Name$ = "Mariana" OR $Name$ = "Joana" => TRUE
4 $Address$ = "Braga" OR $Address$ = "Porto" => TRUE
```

☒ Include TRUE matches ☐ Exclude TRUE matches

Preparação e Exploração Avançada de Dados em KNIME

Preparação e Exploração Avançada de Dados

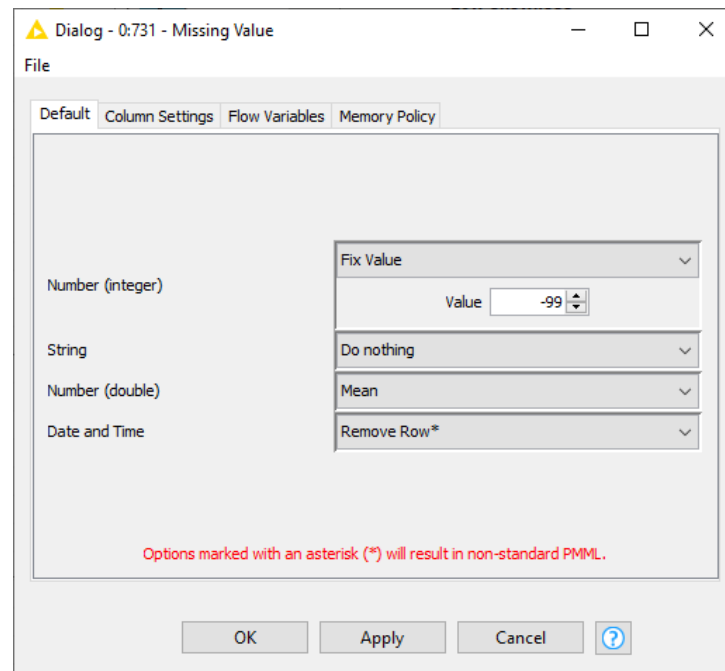

- Tratamento de Valores em Falta/ *Missing Values treatment*
- Discretização em Intervalos/ *Binning*
- Redimensionamento de atributos/ *Feature scaling*
- Detecção de valores fora de limites/ *Outlier detection*

Tratamento de Valores em Falta *Missing Values*

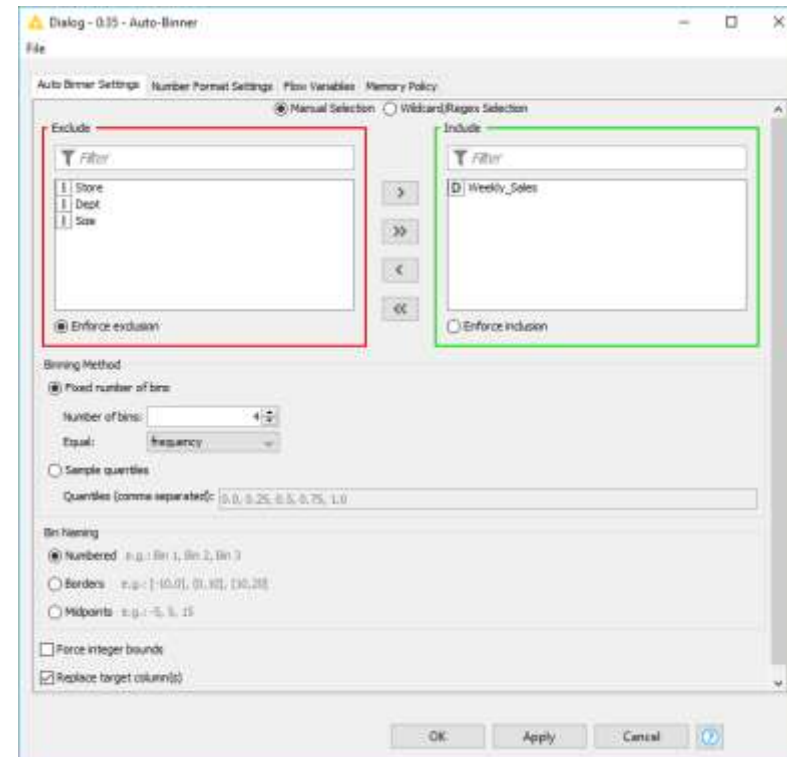

■ Tratamento de Valores em Falta

- Analisar cada atributo em relação à quantidade e proporção de valores em falta
- Decidir o que fazer:
 - Remover
 - Calcular a média
 - Interpolação linear
 - Criar máscaras
 - ...

Discretização em Intervalos *Binning*

- Discretização em Intervalos ou ***Binning***
 - Agrupar valores numéricos em intervalos (*bins*)
- Tornar o modelo mais robusto e evitar o sobreajustamento.
- No entanto, penaliza o desempenho do modelo, uma vez que cada vez que se encerra algo, se sacrifica informação.

Discretização em Intervalos

Binning

- Discretização em Intervalos ou ***Binning***
 - Agrupar valores numéricos em intervalos (*bins*)
- Tornar o modelo mais robusto e evitar o sobreajustamento.
- No entanto, penaliza o desempenho do m uma vez que cada vez que se encerra algo se sacrifica informação.

Redimensionamento de atributos *Feature scaling*

- Normalizar a gama de valores de atributos
- Muitos classificadores usam métricas de distância (ex.: distância euclidiana)
 - Se um atributo tiver uma gama ampla de valores, a distância será muito influenciada por esse atributo.
 - Assim, a gama de valores deve ser normalizada para que cada atributo possa contribuir proporcionalmente para a distância final.

Redimensionamento de atributos *Feature scaling*

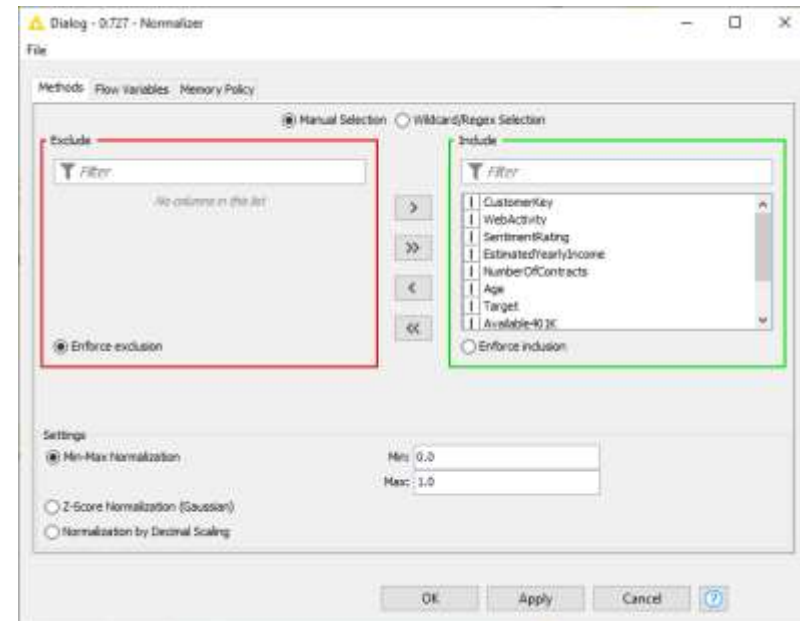

- Normalizar a gama de valores de atributos

- Normalização

Redimensionar os dados para que todos os valores caiam no intervalo de 0 e 1, por exemplo.

$$z = (b - a) \frac{x - \min(x)}{\max(x) - \min(x)} + a$$

Redimensionamento de atributos *Feature scaling*

- Normalizar a gama de valores de atributos

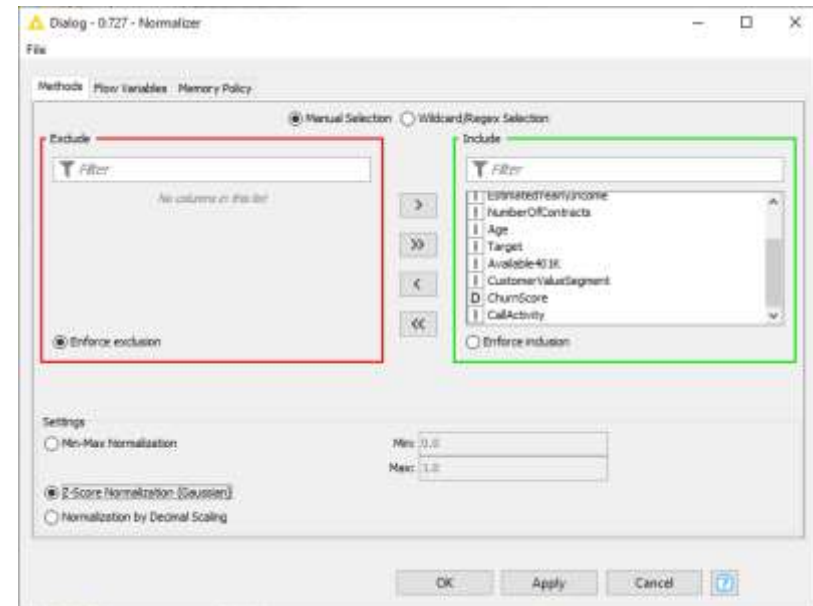

- *Standardization* (ou *Z-score Normalization*)

Redimensionar a distribuição de valores para que a média dos valores observados seja 0 e o desvio padrão seja 1.

Assume que os dados se ajustam a uma distribuição gaussiana com média e desvio padrão bem comportados, o que nem sempre é o caso.

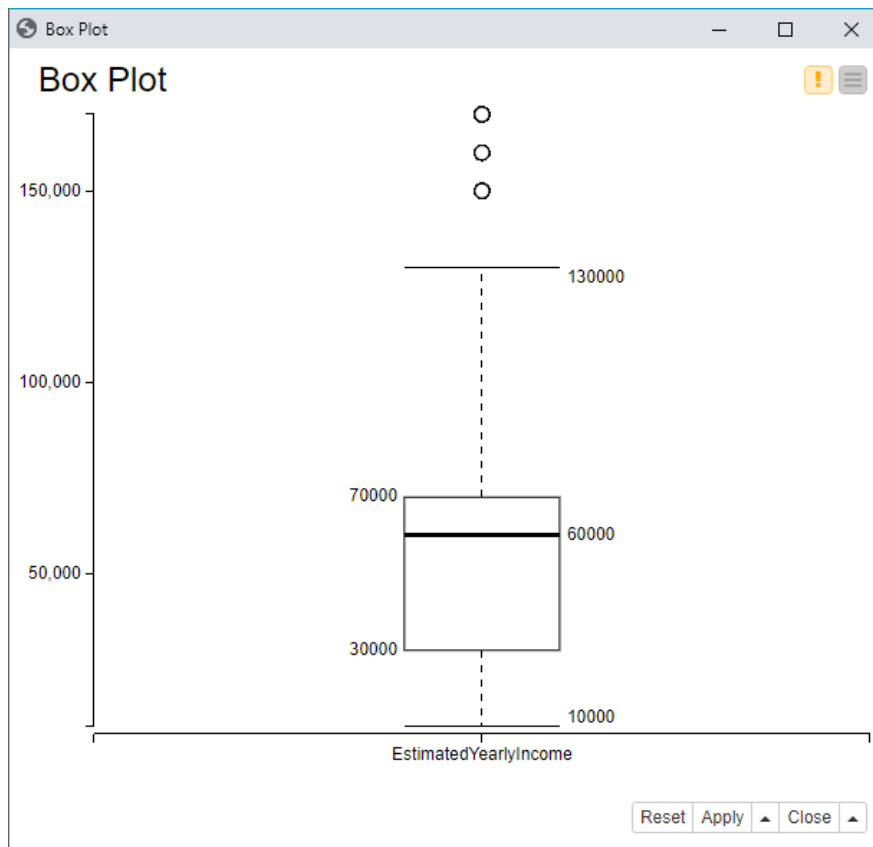

$$Z = \frac{x_i - \mu}{\sigma}$$

Deteção de valores fora de limites *Outlier Detection*

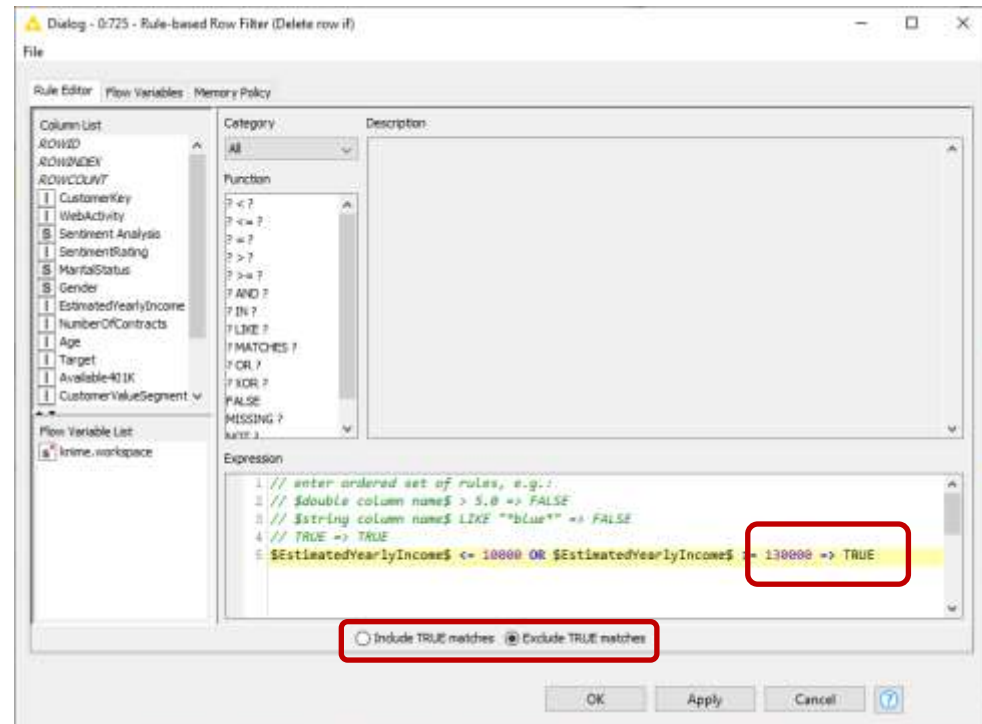

- Deteção de valores fora de limites
 - Estratégias baseadas em estatística
 - Box Plots
 - Z-Score (std. dev)

Deteção de valores fora de limites *Outlier Detection*

- Deteção de valores fora de limites
 - Estratégias baseadas em conhecimento

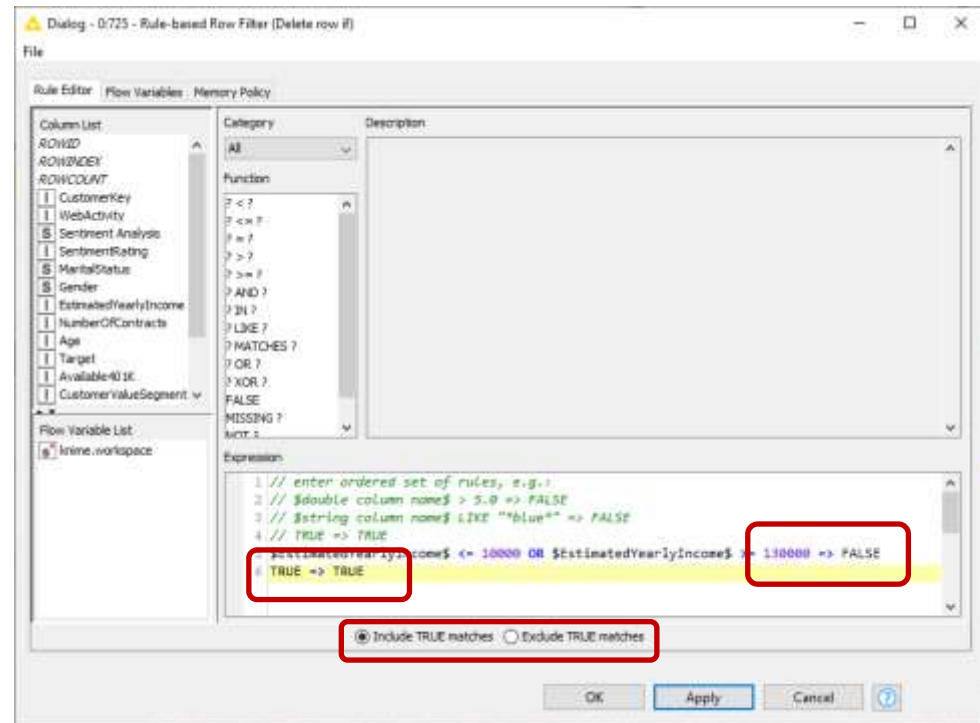

Rule-based Row Filter

Deteção de valores fora de limites *Outlier Detection*

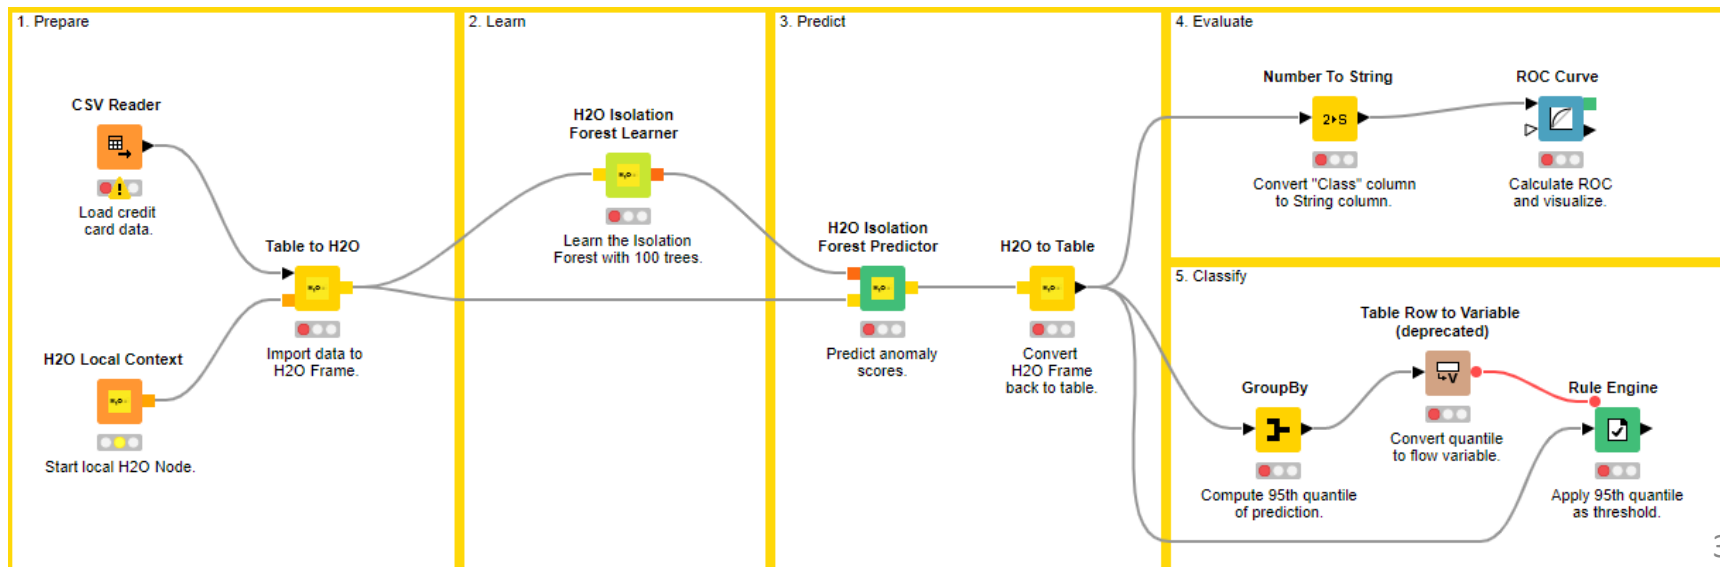

- Deteção de valores fora de limites

Rule-based Row Filter

Deteção de valores fora de limites *Outlier Detection*

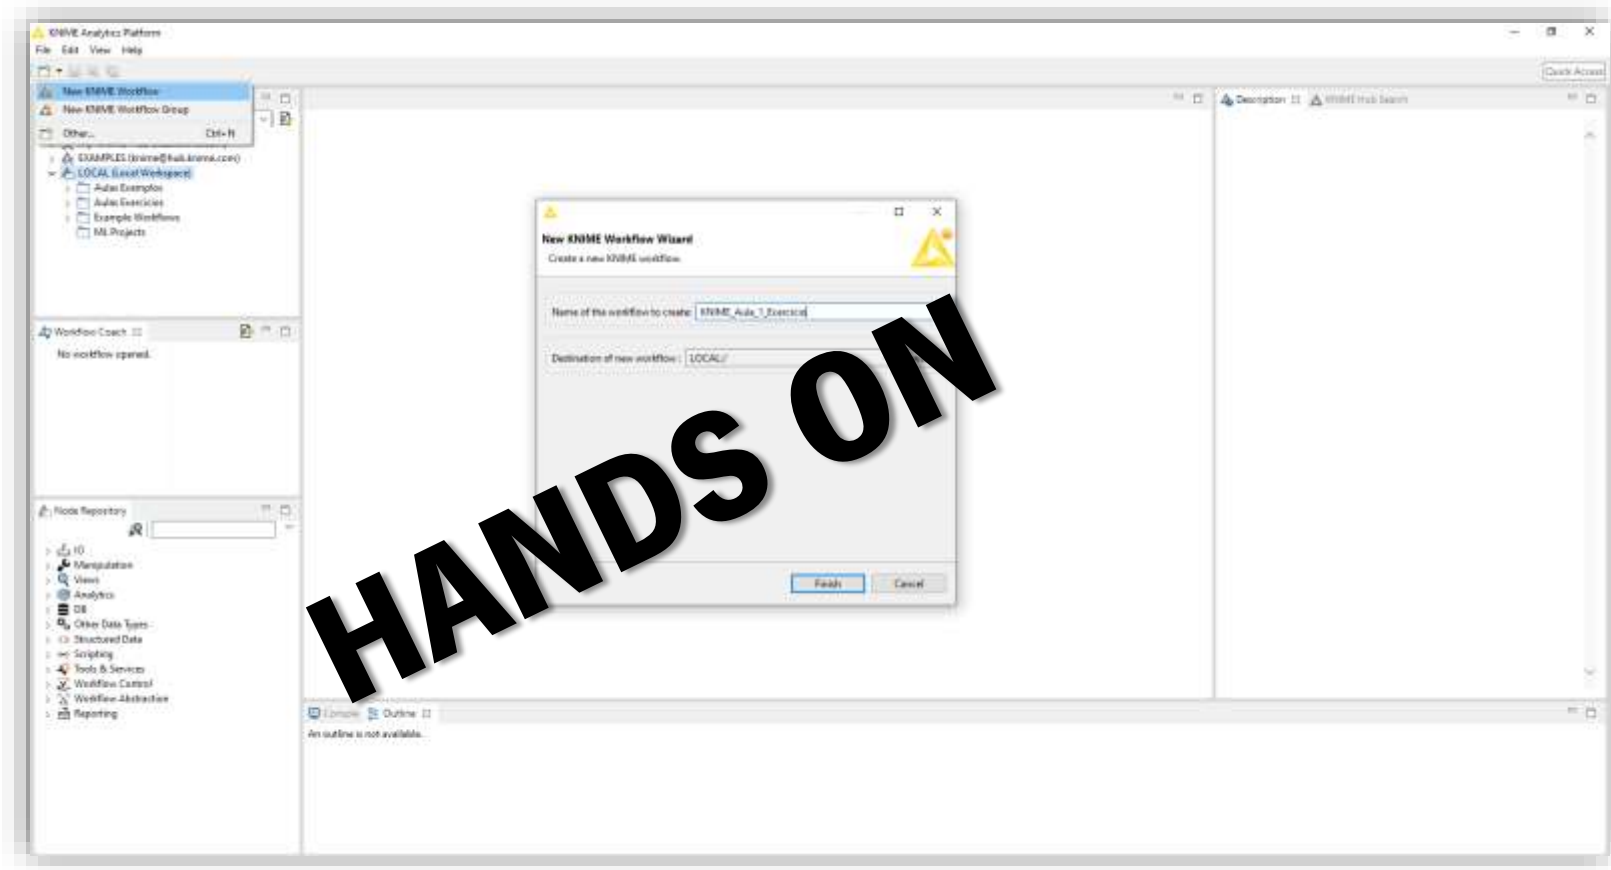

- Deteção de valores fora de limites
 - Estratégias baseadas em modelos
 - Isolation Forest
 - One-Class SVM
 - Minimum Covariance Determinant
 - ...

Deteção de valores fora de limites ***Outlier Detection***

- Deteção de valores fora de limites
 - Estratégias baseadas em estatística
 - Estratégias baseadas em conhecimento
 - Estratégias baseadas em modelos

- ***Outlier Dilemma: Drop or Cap?***
 - Para manter o tamanho do conjunto de dados, podemos querer limitar os outliers em vez de os apagar.
 - No entanto, isso pode afetar a distribuição dos dados!
